CPSC 304 Project Cover Page

Milestone #: 2

Date: Sep 26th, 2024

Group Number: 29

Name	Student Number	CS Alias (Userid)	Preferred E-mail Address
Ziqing Wang	22270649	g0h7c	g0h7c@ugrad.cs.ubc.ca
Owen Zheng	35933183	y6i3e	zcc2280411284@gmail.com
Jiawei Hu	57536633	i5m2m	i5m2m@ugrad.cs.ubc.ca

By typing our names and student numbers in the above table, we certify that the work in the attached assignment was performed solely by those whose names and student IDs are included above. (In the case of Project Milestone 0, the main purpose of this page is for you to let us know your e-mail address, and then let us assign you to a TA for your project supervisor.)

In addition, we indicate that we are fully aware of the rules and consequences of plagiarism, as set forth by the Department of Computer Science and the University of British Columbia

Summary

Our project features ticketing services of various concert venues. Users are able to book tickets, view the concert information and rate concerts according to our database specifications.

Changes from Milestone 1 for ER Diagram:

Reason to change: To be more descriptive. For the last point, just to add more FD to work with.

- **Performers** “attend” **Concert** rather than “has” a concert.
- erid and ertype for **Emergency Response** rather than type and id.
- cid for **Concert** instead of id.
- audiencename for **Audience** instead of name.
- pid, pname, pphone for **Performer** instead id, name & phone.
- assistant name, assistantphone for **Assistant** instead of name & phone.
- scname, sctype instead of name, type for **SponsorCompany**.
- seatnumber instead of seat#.
- buildingnumber instead of building#.
- Added seatlocation for **Ticket**, province and city for **Location** because we want to add more FD to the relational database.

Reason to not change:

- We keep the PK of the Location unchanged. The example on page 8 of the slide inspired us. We think only postalcode, street and building# can uniquely identify the Location. We also hope that the points deducted because of this could be earned back from milestone 1 because this was a working example illustrated in slides.

postalcode, street, buildingnumber -> city

postalcode, street, buildingnumber -> province

postalcode -> city

postalcode -> province

street, city -> province

Assistant_Assist:

aid -> assistantname

aid -> assistantphone

aid -> pid

We intended to turn all tables into 3NF. (Steps shown on the next page)

Table_Purchase_Has: Lossless join method

Location: Synthesis Method

Ticket-Purchase-Has

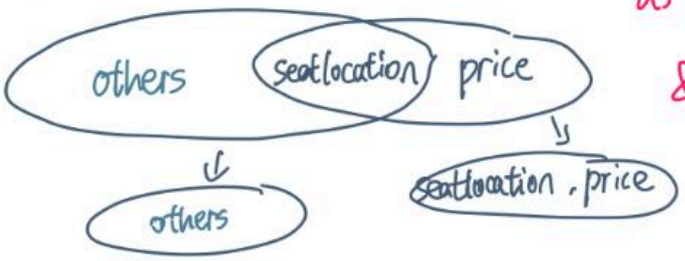
1. in the FD, seatlocation → price, seatlocation isn't a superkey & price isn't a part of the key.
   ∴ It's not in 3NF

2. ① Done. All RHS contain only 1 attr
   ② Done. Because LHS already minimized
   ③ Delete seatnumber, cid → price b/c price can be implicitly determined by seatnumber, cid.

3. Decompose from reduced FDs.

seatnumber, cid$^+$ = {seatnumber, cid, paymentmethod, paymentlocation, email, price, seatlocation}

seatlocation$^+$ = {seatlocation, price} violates 3DNF as price isn't part of key & seatlocation isn't a super key



Take all key's combination's closure that is in FD.

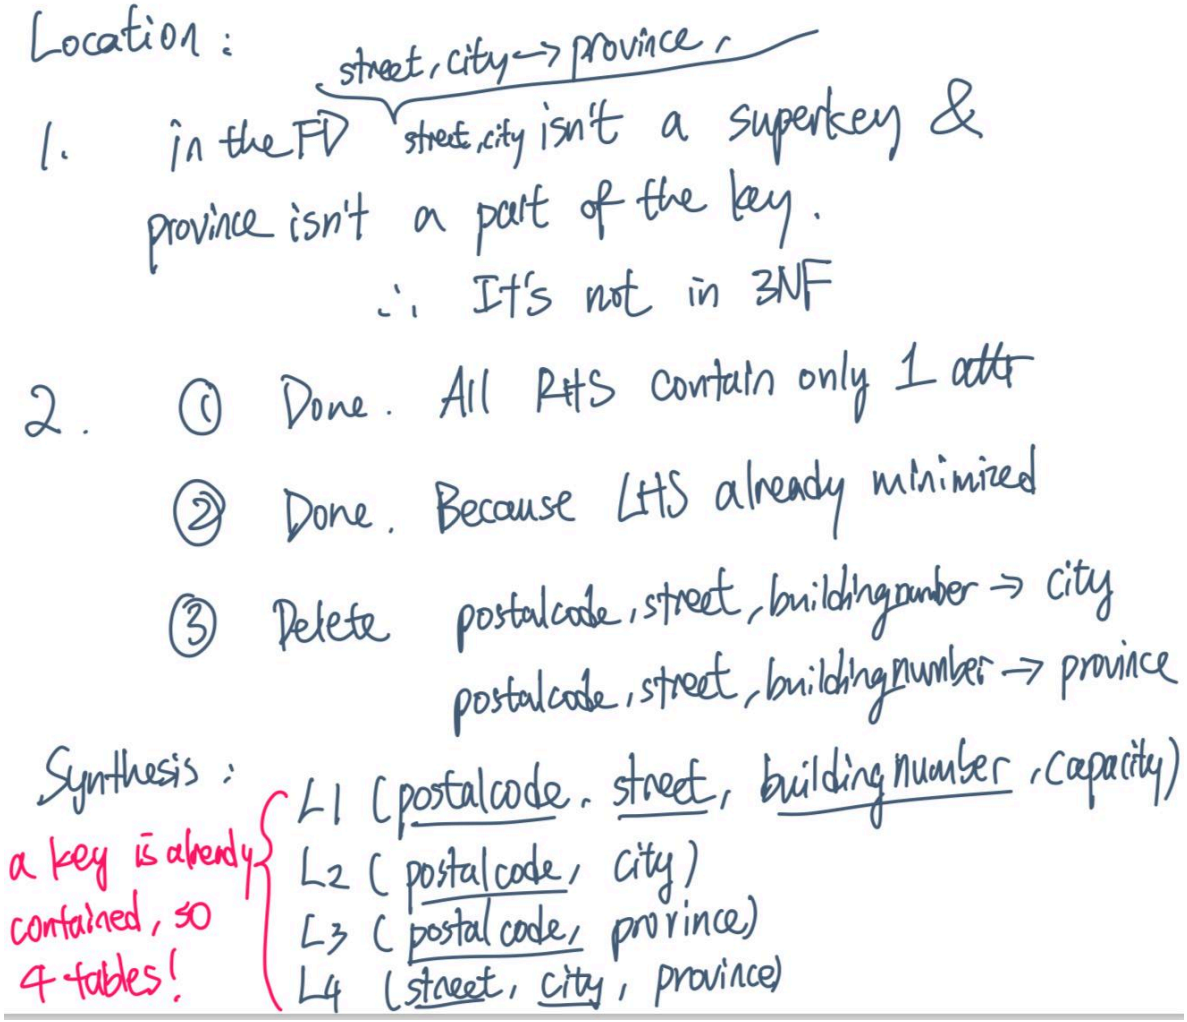
seatnumber$^+$ = {seatnumber} } trivial; and no more other interesting closure to take
cid$^+$ = {cid}

∴ TPH1

payment method, payment location, email, seatlocation
r seatnumber, cid

TPH2

seatlocation, price



Resulting 3NF Tables

1. EmergencyResponse (erid: NUMBER(4, 0), ertype: VARCHAR2(50))
